Genotype phenotype worksheet middle school

The genotype vs. Genotype phenotype and the phenotype are closely related in the genetics of an organism. Genotype is internal genetic information that determines the external appearance, or phenotype. The genotype is the genetic composition of an organism. It is responsible for hereditary genetic information. Each individual, with the exception of identical twins, has its own genotype. The genotype is carried on two alleles in the cell, one of each parent, which may be the same or different. In sexual reproduction, the genotypes of the parents contribute to the genetic makeup of the child. The phenotype is the observable traits of an organism that result from its genotype. Traits such as hair color or the ability to roll your tongue are part of an individual's phenotype. It includes features such as size, shape, color and behavior. The phenotype is affected by the environment and can change over time. The phenotype depends on the genotype. It is the external and observable expression of the genotype.
